

Wild Actor

Actor to Investigate

Chang Su

Actor Investigate

Jasminum nudiflorum

- location: It's all over my community yard.
- It blooms at a slight increase in temperature. But the flowering period is very short

Mentha

- location: I don't know who planted it in the flower bed downstairs.
- When I go to my cousin's house, I pick some and use it to flavor my salads.

Pachiramacrocarpa

- location: It's on my balcony.
- I feed it occasionally, but this plant doesn't really need a lot of water. The Chinese believe that the tree will bring a lot of money to the family.

Crassula arborescens

- location: It's on my observation deck.
- To me, it's a fat-looking plant. The leaves are thick and feel full of fat.

Zanthoxylum bungeanum

- location: It's on a quiet path that I pass on my way to my cousin's house.
- All the leaves have fallen off because of the winter. But in summer, there will be green leaves and fruits, which I pick occasionally. Chinese prickly ash

Zanthoxylum bungeanum

Story:

This Chinese pepper tree is on my way to my brother's house. It bore fruit during the summer holidays. I've picked a few of them. They're soft. In my mind, the fruit is very ugly, like a booger. Later I liked it just because of the taste.

The spikes are really annoying, It scratch a hole in my Down Coat in winter.

Location:

Outside

Zanthoxylum bungeanum is a deciduous shrub with a height of 3-7m. The stem usually has enlarged prickles; the branches are gray or brown gray, with small lenticels and slightly upward prickles;

<i>Zanthoxylum kauaense</i>	
Scientific classification 	
Kingdom:	Plantae
Clade:	Tracheophytes
Clade:	Angiosperms
Clade:	Eudicots
Clade:	Rosids
Order:	Sapindales
Family:	Rutaceae
Subfamily:	Rutoideae
Genus:	<i>Zanthoxylum</i> L.
Type species	
<i>Zanthoxylum americanum</i> Mill. ^[1]	
Synonyms ^[2]	
List	[show]

Seed&Fruit :

Exocarp surface is very wrinkled, many wart-like oil glands can be seen, the diameter of the oil glands is 0.5 ~ 1 mm; **Endocarp smooth**, light yellow, often separated from the base and exocarp to roll inward. Remnants of **black seeds** are sometimes seen. **Fruit leathery**, with a special strong **aroma**, **spicy** and **lasting** taste. With bright red, bright, fine skin, uniform, no impurities for the best.

Application :

The **fruit** of several species is used to make the **spice Sichuan pepper**.

Relieve pain

kill insects and relieve itching

Treat vomiting and diarrhea

Help digestion

External treatment of eczema pruritus

The extract has a narcotic effect

Bark :

Short spines is really hard.

Application :

The wood is light yellow. The color becomes dark yellow slightly in the air, the difference between the sapwood of the heart is not obvious, the xylem structure is dense and uniform, the longitudinal section has the **silk luster**, and the big wood has the value of **arts** and **crafts**

Living environment :

There are 5 tree in the whole neighborhood, which is next to the other buildings. It's hard for sunlight to reach it.

There is a **narrow path** around it.

Every month, the ~~green-chemical~~ **gardener** people in the community will walk on this narrow road with a plastic pipe and connect the tap to water all the nearby plants, including this pepper tree

My taget is first tree. Around its roots is a **four-leaf grass**.

There are **four** of the same trees near it

Zanthoxylum bungeanum

New Discover :

The **thorns** of a Chinese prickly tree do **not grow on all the branches** of the tree. Thorns grow only on **new, thinner** branches. Old branches shed their spikes. **And the newer/younger the stems, the more thorns they have.** This reminds me that in human society, older people are more composed and less sharp than younger groups. At the same time, younger groups are more individualistic and aggressive, like these thorns.

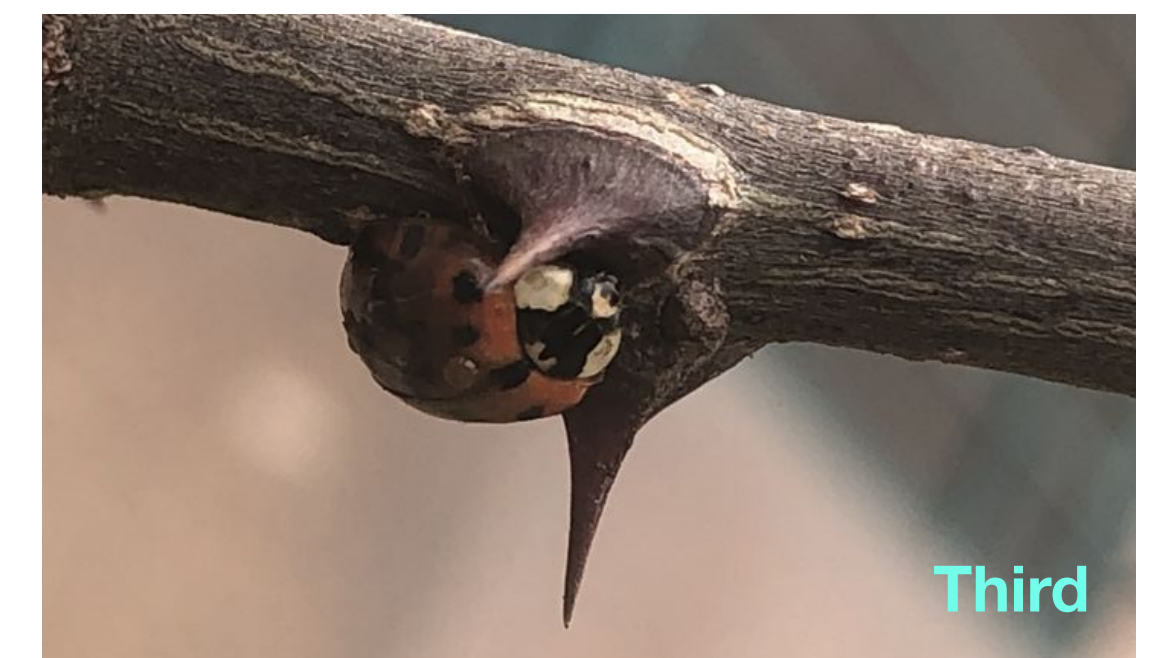

Second :

All **thorns** grow in an **upward direction**, and I suspect that the growth of sharp thorns is **not** influenced by the **sun**, but is indeed influenced by the plant's **protective mechanisms**. It grows **downward** in order to protect wildlife from the the ground.

Third:

All the new branches grow between the two sharp thorns. This time, the ladybugs (pests) were accidentally photographed eating the sprout

I realized that the plant system might contain a social system similar to that of humans.

Translation

I use a different medium to record every part that I find interesting. I want these mediums to reflect how different parts of the tree work and how does it interact with humans

Idea1:

Keyword: attack

The material I use is **tin foil**. I recorded the state of the spines after they **fell off** by **wrapping** the trunk. **Creases** in the tin foil record these **intricate fluctuations**. This is similar to the human society, time will smooth people's closed angle, leaving behind the part will become smooth

I realized that the plant system might contain a social system similar to that of humans.

Idea2:

Keyword: attack/protect

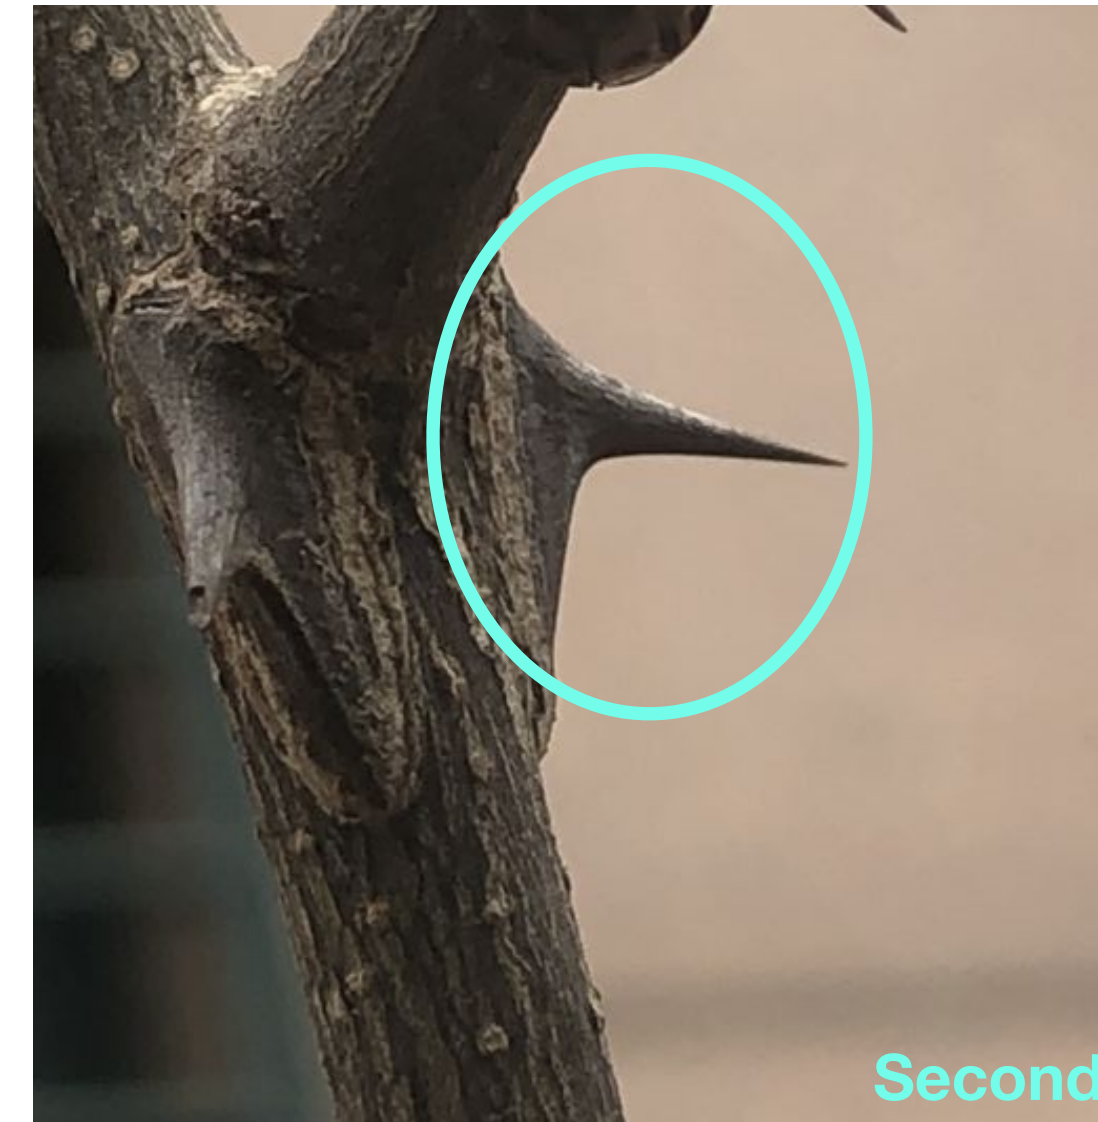

For this characteristic of sharp thorns growing down.

The medium I used was an **apple**. I want to express the **damage** caused to the intruder when the tree is invaded by other animals or humans.

Because on my way to my cousin's house, it's easy for me to get caught in my pants, and I'm sure people who pass through here will have the same problem.

I didn't want to try it with my hands, so I chose an apple, whose smooth surface and juicy flesh match the texture of the human body very well.

Next week, I'd like to try some more ingredients, maybe fruit. To create a more striking visual effect

Idea3:

Keyword: protect

All sprout are protected by at least two sharp spines
