

Growing

P-3

Chang Su

Zanthoxylum bungeanum

From project1. I use my leg to draw. I thought my body can expressed their thinking by moving. **Keywords:Flexible, self, painting**

From project2.The Object from body to planet. Therefor, I Just how to use the planet to drawing?**Keywords:Sharp, aggressive, hard**

Three Direction

- **Idea1-Soil&Water**

I am interested in “Zanthoxylum bungeanum”’s Thorns. This is about the characteristics of the plant itself. And then I was very curious, how do these incredibly hard spines respond to threats in the outside world? This barrier may be caused by **soil and water**

- **Idea2-Temperature**

I will combine the growth pattern of spikes with the method of using the body as the brush tool in Project 1 to record the response of plants when they encounter external obstacles. This barrier may come from a change in **temperature**

- **Idea3-Human factors&natural enemy**

In Project, I showed the impact side of Chinese jasmine tree. In the following project, I would like to try to explore the difficulties encountered by Zanthoxylum bungeanum in its growth process, such as **human factors and natural enemy** obstacles.

- **Idea3-human factors & natural enemy**

In the first project, I used the body as a brush tool and the joints as a support point for motivation. Draw the movement of the legs in the process of wearing shoes.

I would like to apply the method of locating nodes to the study of thorns in pepper trees.

Using the Thorns as a node for the growth of the pepper tree, showing the various obstacles that the spike encounters during the growth process

First obstacle from human. Because the growth of the pepper tree tends to grow horizontally, and the spikes always grow on the new branches. Gardeners will tie them with ropes and fix them in a certain space, I n order to prevent spikes from hitting pedestrians. Like these photos.

- **Idea3-human factors**

A branch pulled by a rope. I was thinking, what would happen if I cut the rope short? Will the prickly branches pop up as the bondage disappears? Branches have adapted to the state of tied ropes and tend to stabilize? Or is it growing in another direction?

Action1—Cut rope, Spring&Shooting Branch

Action2—Cut rope,A still branch,Unlimited growth, moving in one direction

Action3—Cut rope, Grow to other direction

- **Idea3- Natural enemy**

In project3, I would like to try to explore a kind of Obstacles by *Zanthoxylum bungeanum* in its growth process, These obstacles away from **human active and natural enemy**.

Last week I explored how thorns respond to obstacles posed by **human activity**. This week I use some media that I hope will better show the obstacles encountered during the growth of the **bud**.

How do I draw with branches? I have a new method. Following natural enemy footprint. Because the buds haven't come out yet

Because of the bud will growth from thorns and some bug will eat the bud.

The insects' tracks record the growth trend of the buds

- **First-Aphid**

I began to wonder what the insect - covered branches would look like.

Depending on the type of insect, the effect will be different

- **Second-Spider**

The spider would hang from it, a bit like a lantern hanging from a tree.

- **Third-Papilio**

The spider would hang from it, a bit like a lantern hanging from a tree.
